

# Change Scanner Network Settings

This document contains instructions for changing network connections on a Motorola MC67 or MC75A handheld computer (scanner).

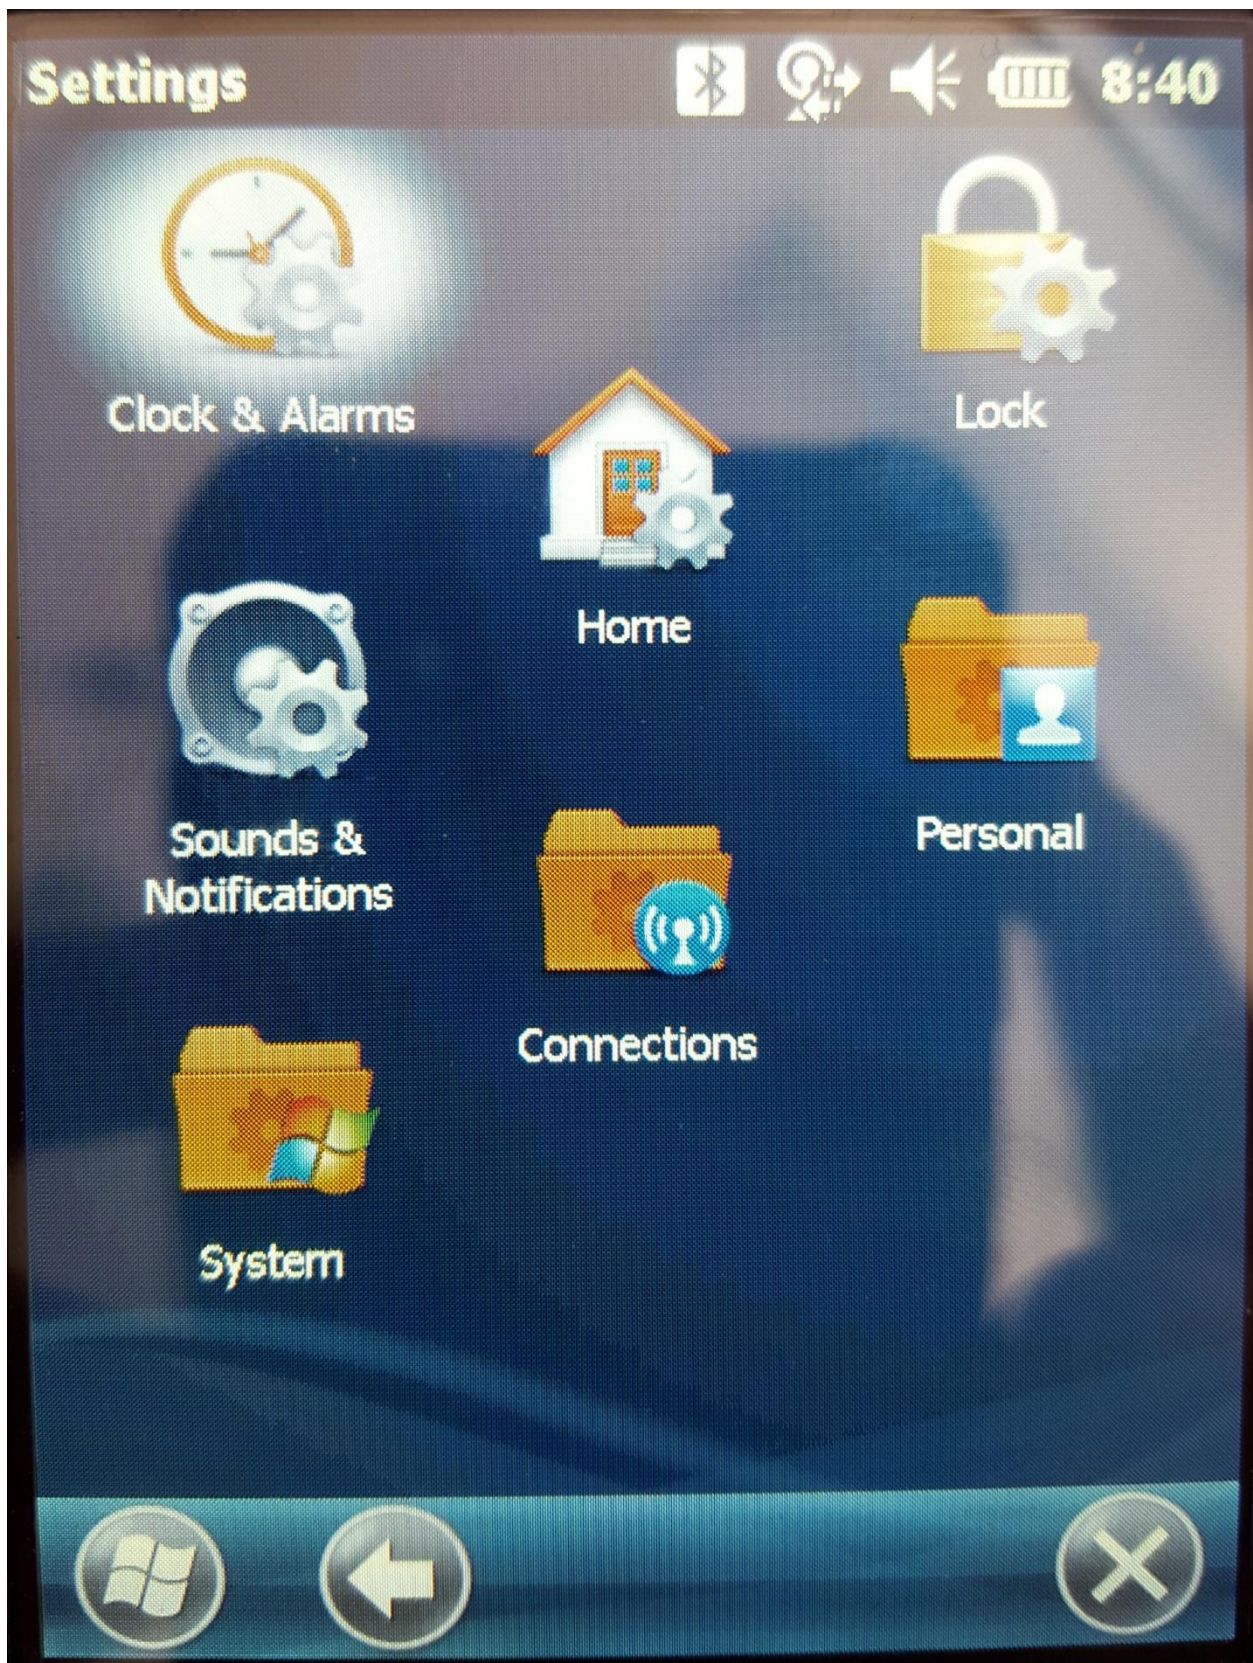

When connected to a MiFi device the scanner will have a connection to the internet when the MiFi is in cellular range. If the MiFi is in cell range and the scanner is connected to it but an internet connection is still not usable follow these instructions.

First select Settings from the desktop (gear icon).

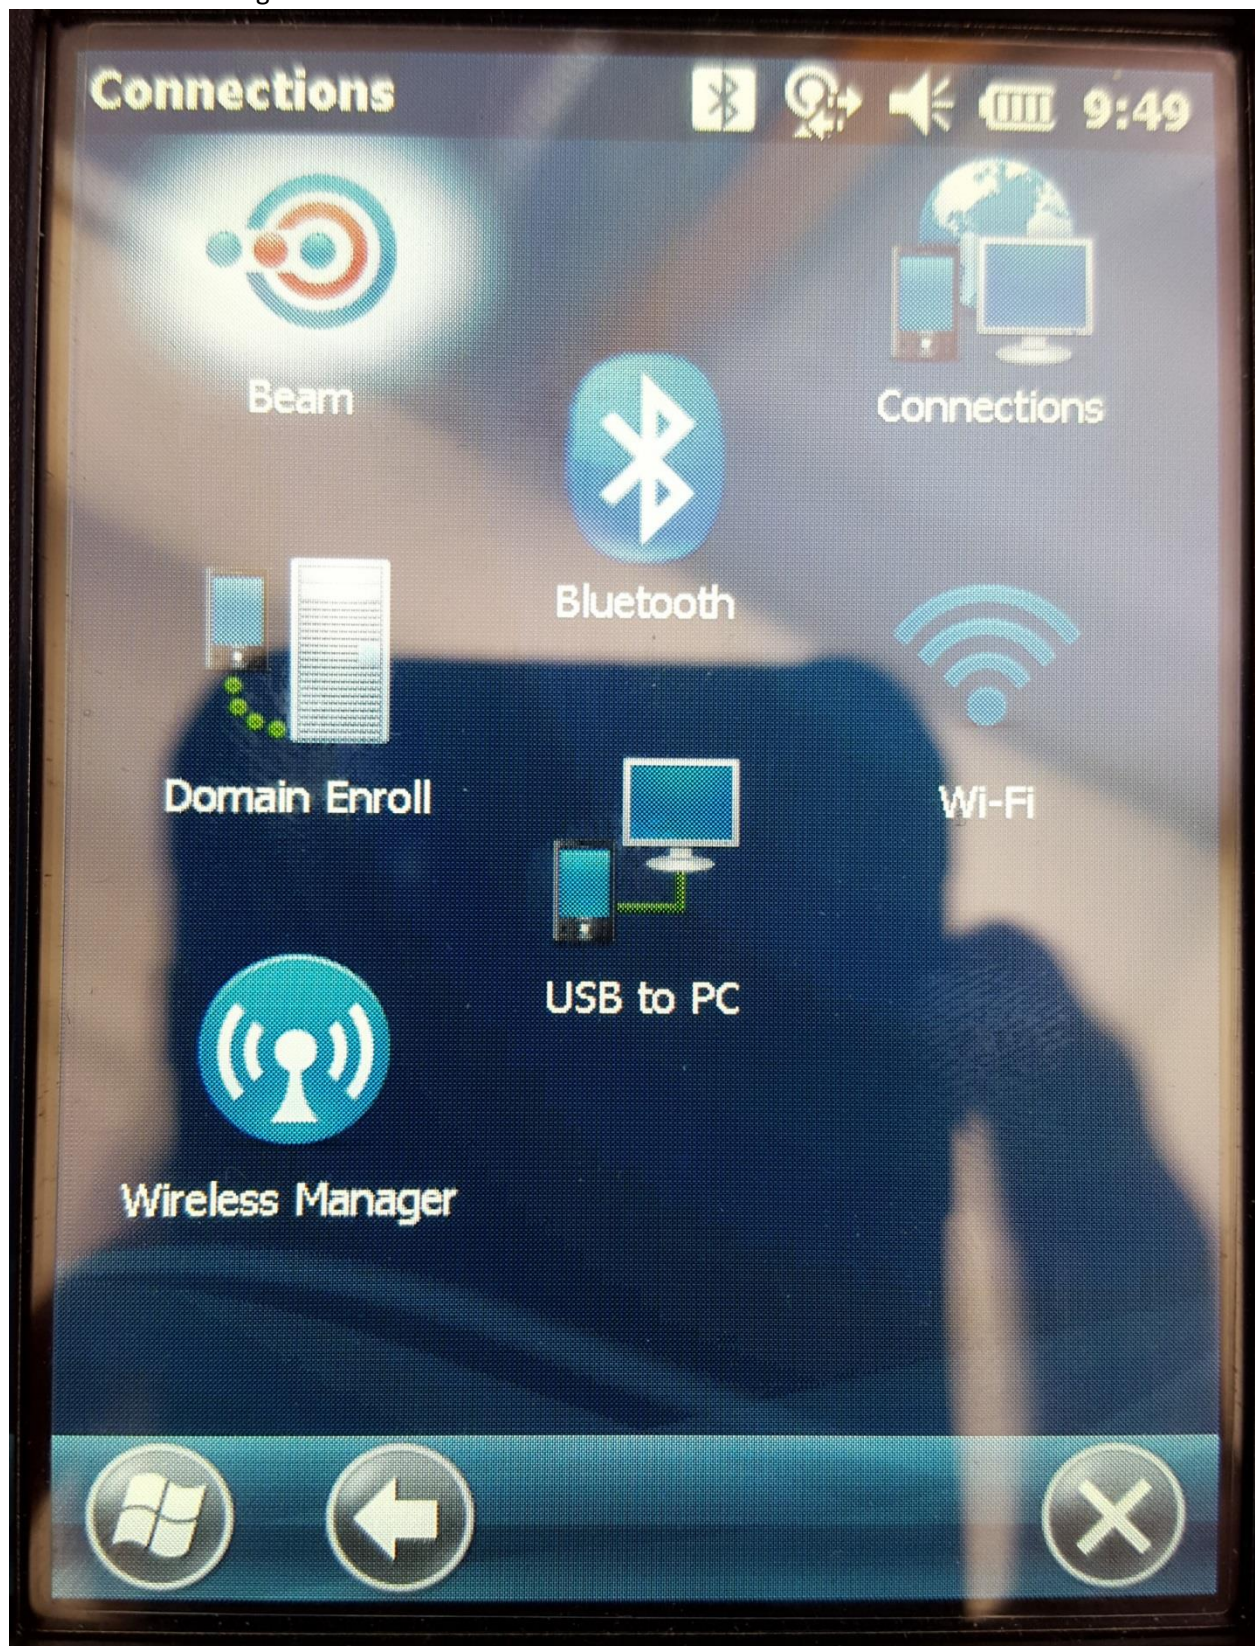

Select Connections

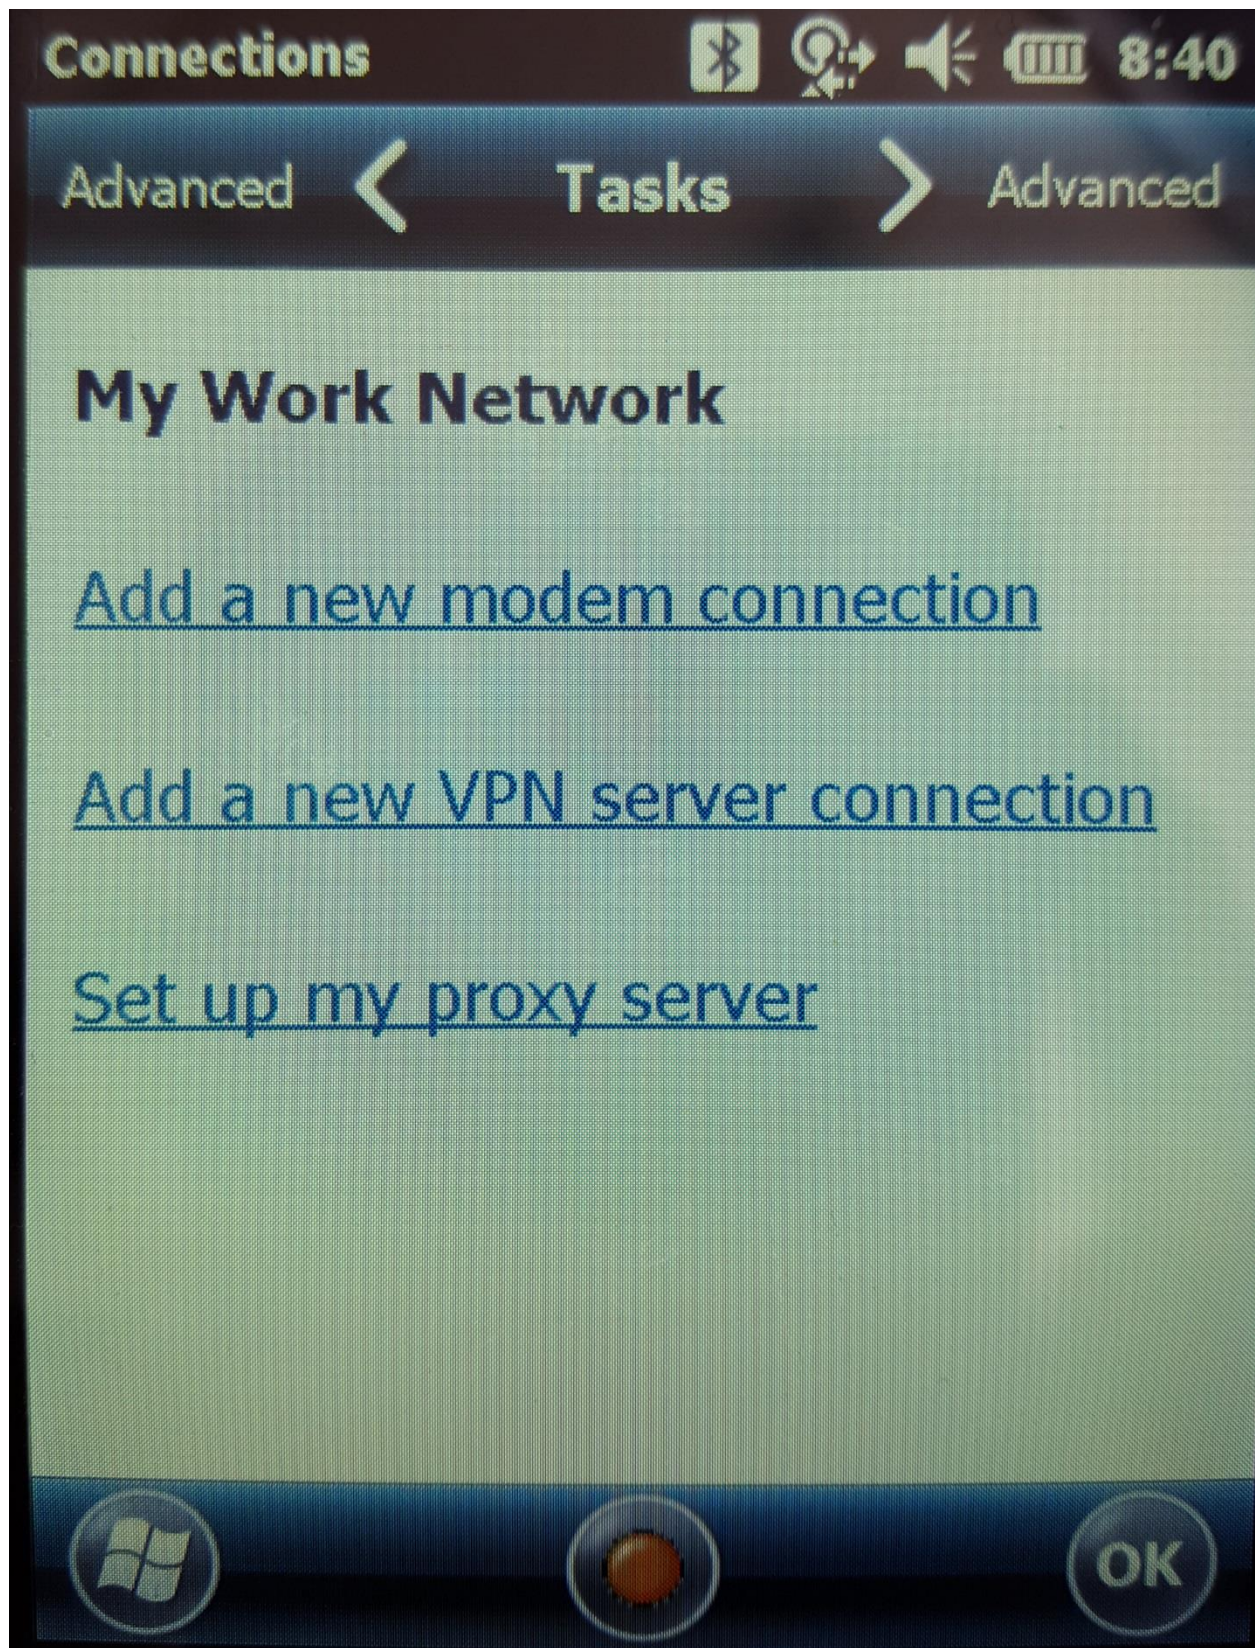

Select Connections again

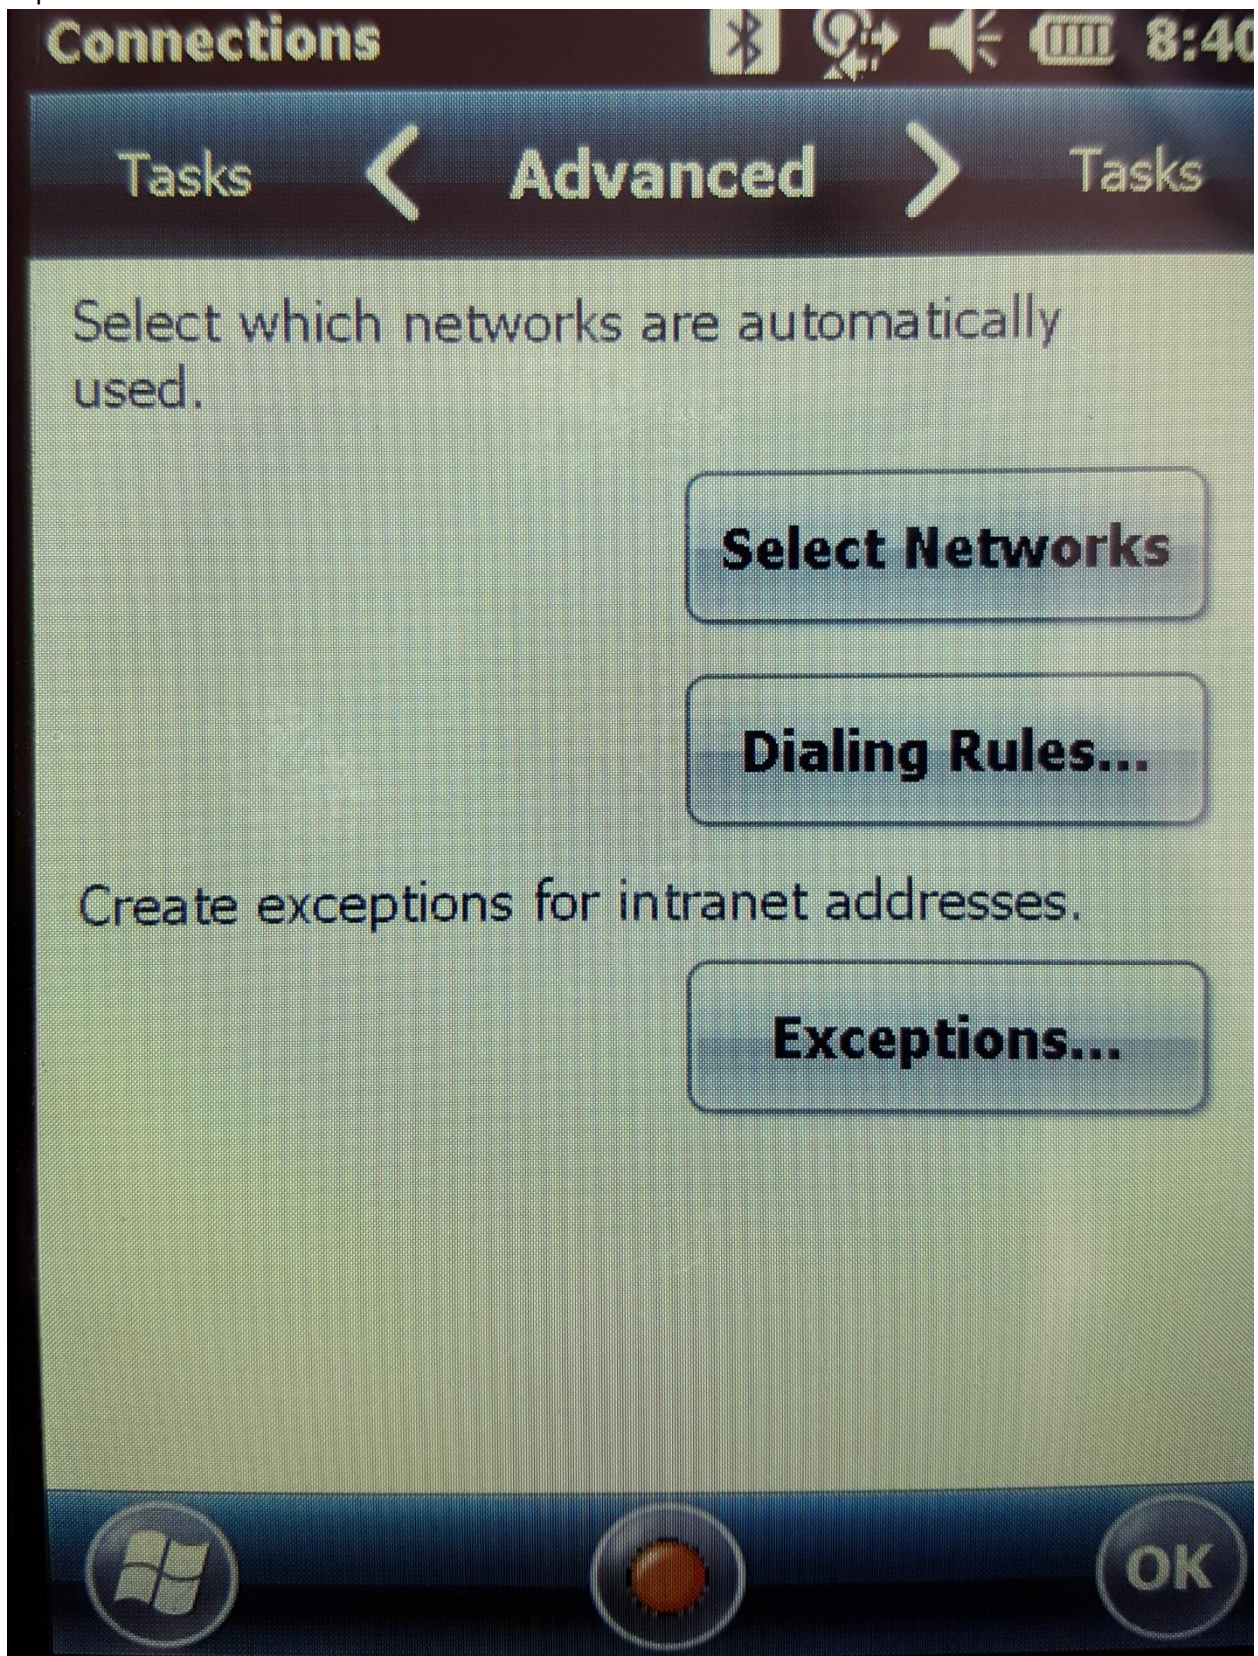

Tap the Right or Left arrow

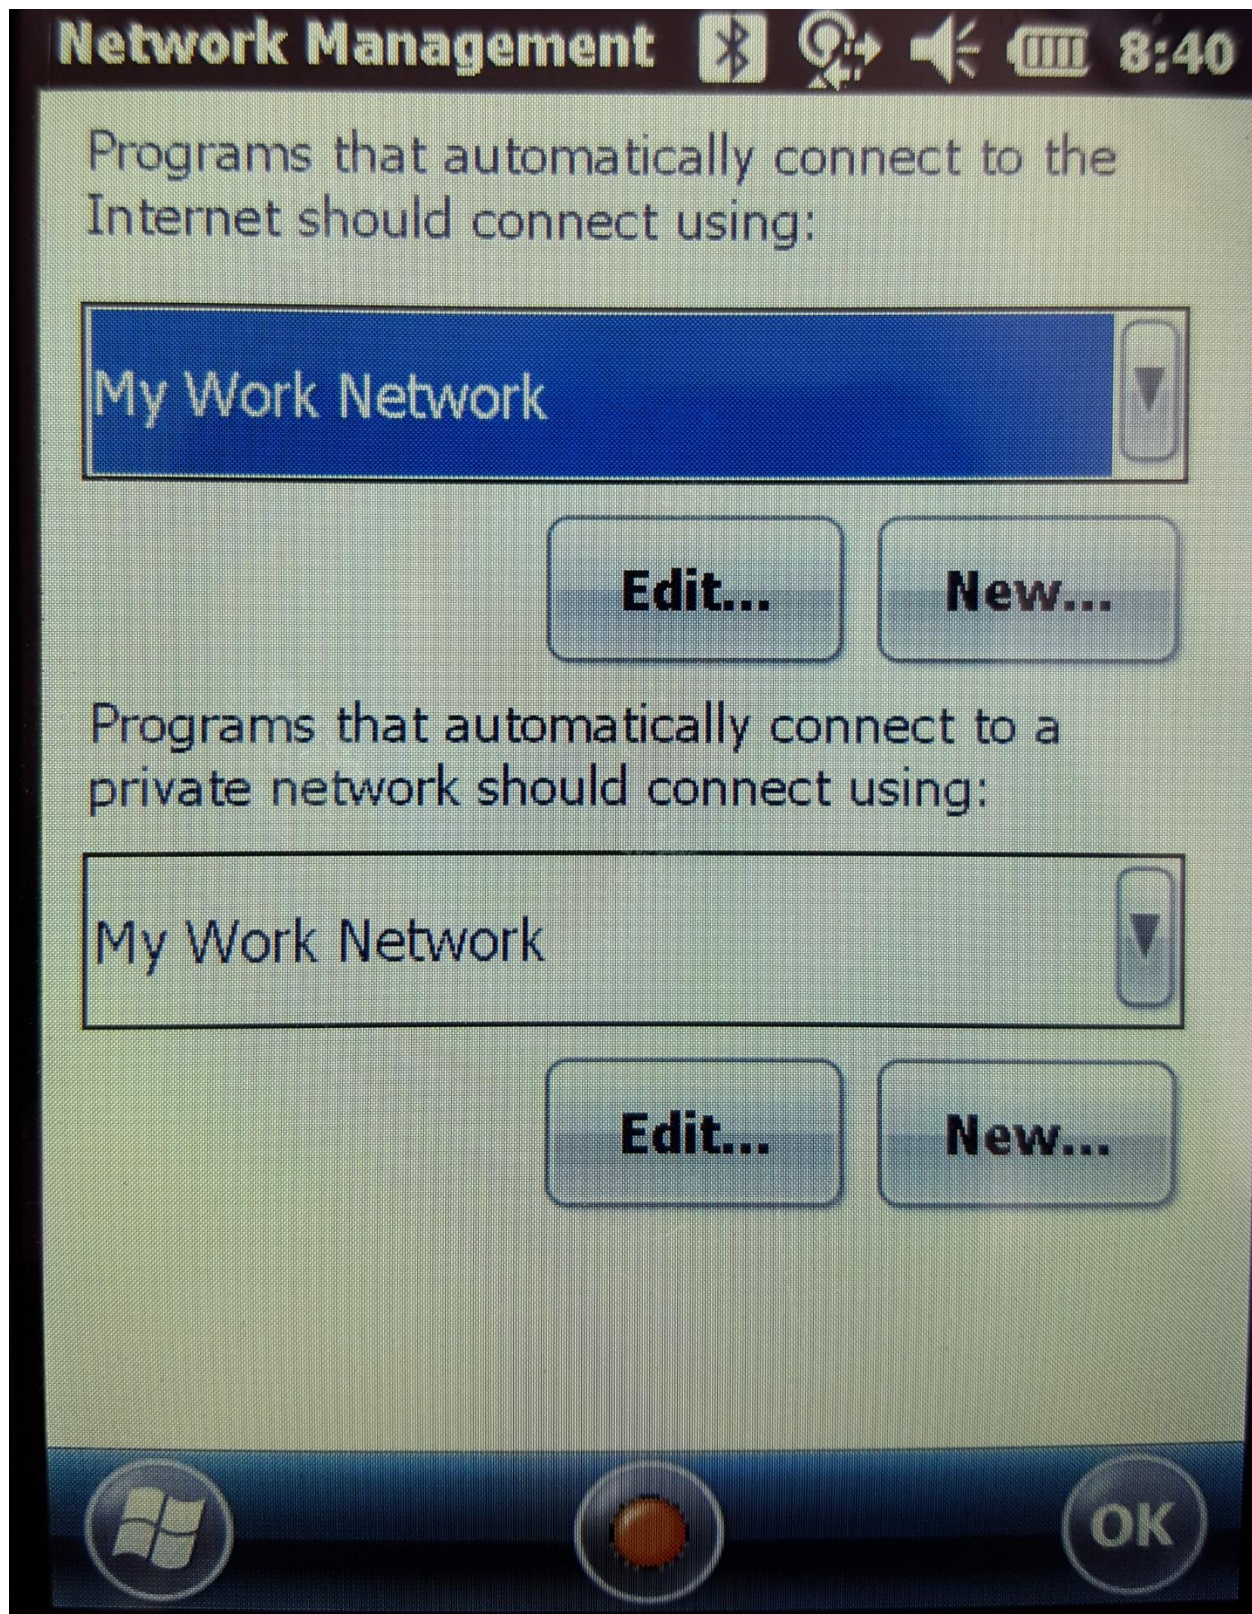

Tap Select Networks

Change My ISP to My Work Network. When done the screen should look like below.

Press OK and try to visit an internet page.
